

# InsightIQ™

Customizable and modular surveillance that prioritizes patients and highlights the most relevant data

## Unit Surveillance View

This view shows a 10-bed ICU with one patient screened positive for Sepsis, highlighting it in more detail in the top half of the screen. Clicking on any of the beds will take the user to a more detailed Single Patient View.

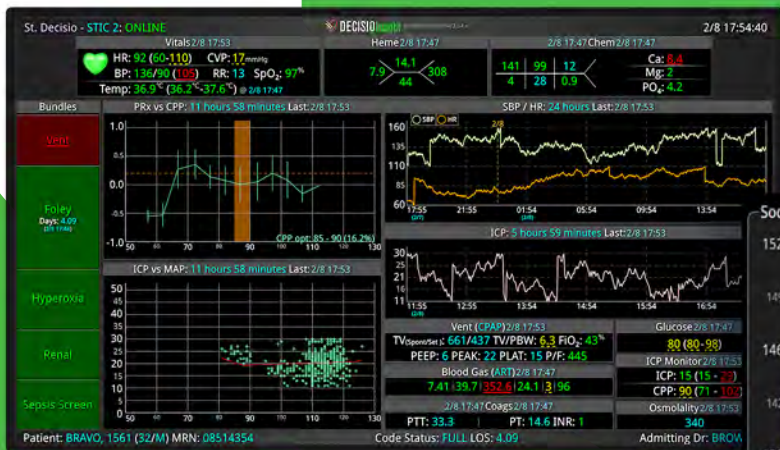

## Single Patient View

This view shows a patient with the bundles of care specific to a Trauma ICU. Each section can be configurable for your hospital unit. Using the department's preferred inputs and workflows, InsightIQ drives compliance with unit-specific protocols and reduces avoidable escalation of care.

## Management of Traumatic Brain Injury (TBI)

### Pressure Reactivity Index (PRx) Dashboard

### Sodium (Na) and Salt bomb graphs

# InsightIQ™

## National Early Warning Score (NEWS)

Determines the degree of illness of a patient and prompts critical care intervention.

## Labor and Delivery

This display provides clinicians the ability to assess the status of their maternal patients, utilize hospital defined protocols to identify patients at-risk and track adherence to hospital defined best practices including hypertension, hemorrhage, and medication management.

## Management of Acute Kidney Injury (AKI)

We detect subtle changes in kidney function that can help prevent deterioration. In this example, InsightIQ displays those patient medications that have a harmful effect on the kidneys.
